

ICRI Studies on RCF and Rail Grinding

TT: Transverse Top-of-Rail (TOR)

TG: Transverse Gauge

Eric Magel and Daniel Szablewski
Automotive and Surface Transportation
National Research Council of Canada

HEAVY HAUL SEMINAR • MAY 2-3, 2018

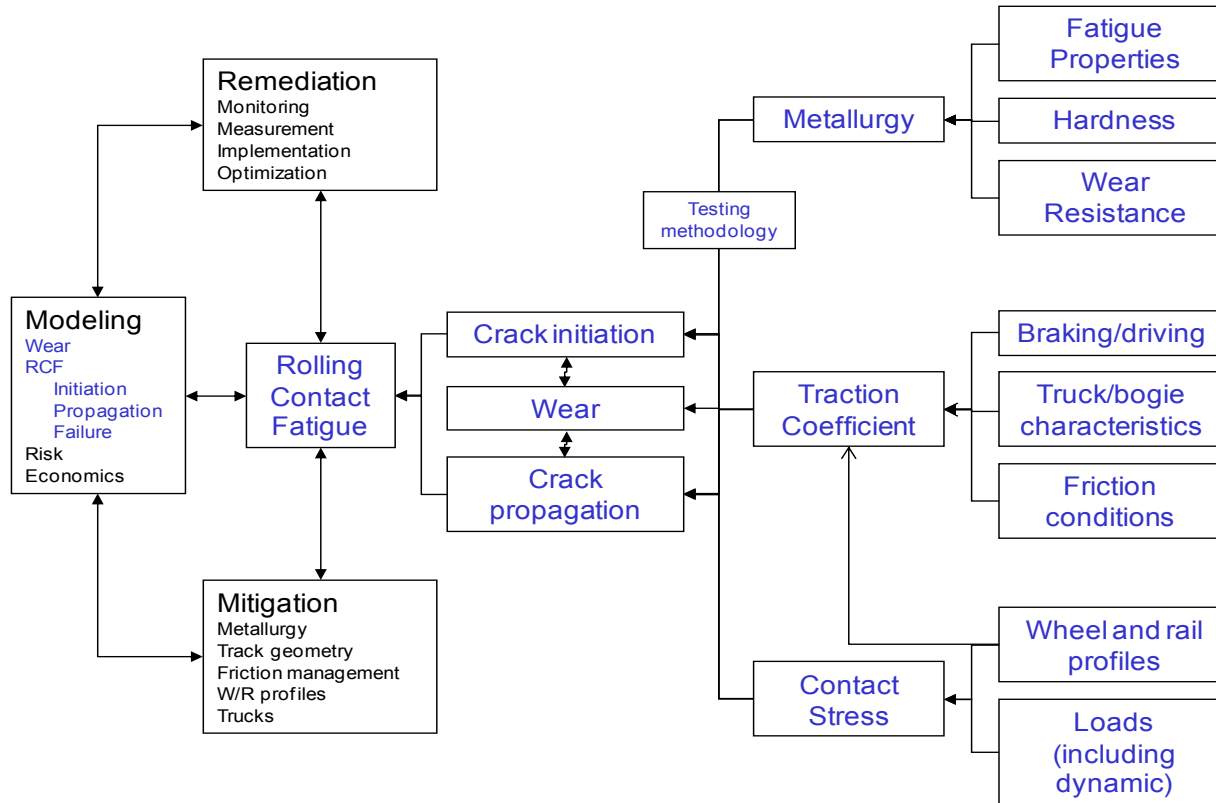

WRI 2018

Outline

- ICRI Introduction
- 4 ongoing projects related to RCF
 - Quantifying Surface Damage
 - Performance of new rail before first grinding
 - Predictive rail grinding
 - Damage modeling

Managing Rolling Contact Fatigue

2011 – FRA workshop
Magel: RCF Review

ICRI – International Collaborative Research Initiative

- Bring together interested parties to work on topics of common interest
- Leverage resources (personnel, models, data, field studies) where they can be shared
- Minimize overall costs – no “re-inventing the wheel”
- Minimize administrative overhead – informal, “open-source”

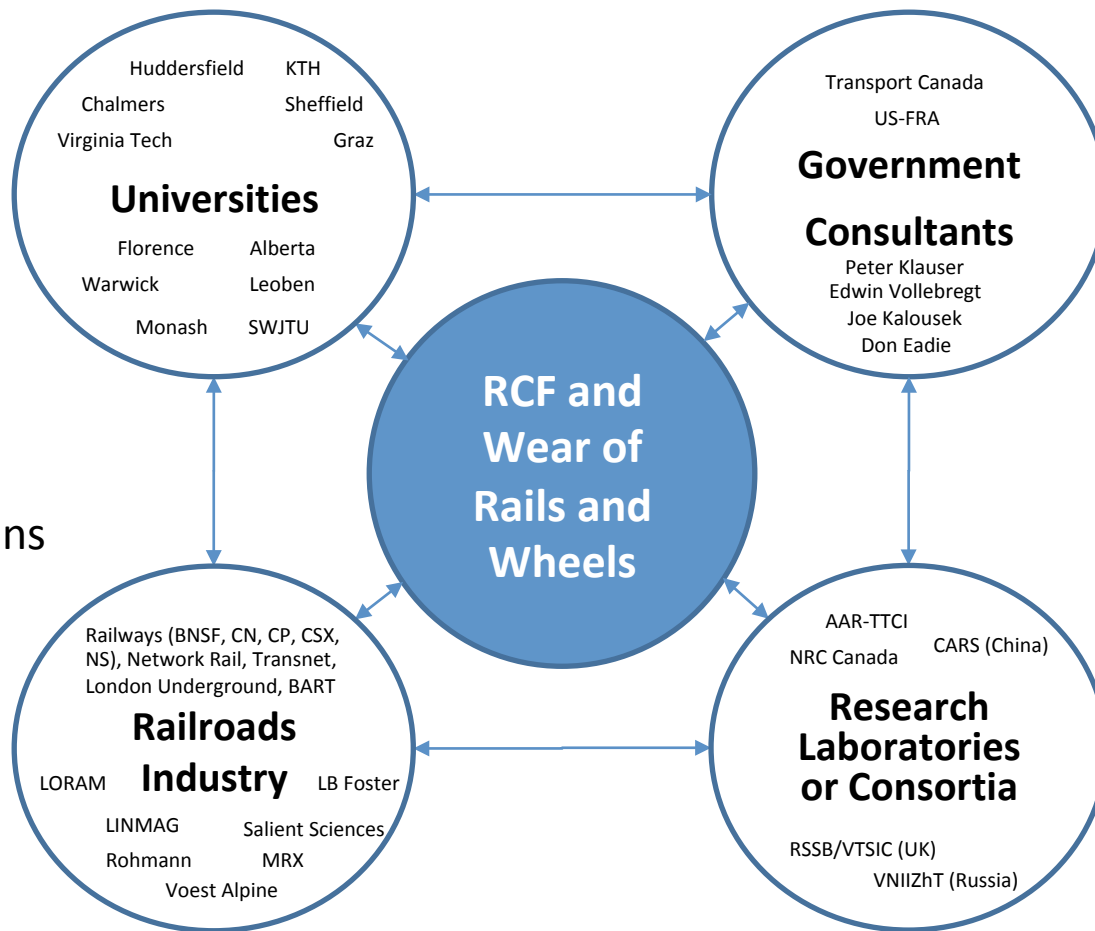

The ICRI - operating model

- Participants contribute data, expertise, models, ideas *from existing projects*
- All contributions are “in-kind”
- The ICRI IS NOT a funding body. Each participant is self-funded (obtains funding by conventional means from existing clients)
- Information shared amongst all participants
- For most: not explicitly looking for new money, but need authority to share
- “Open Source” model

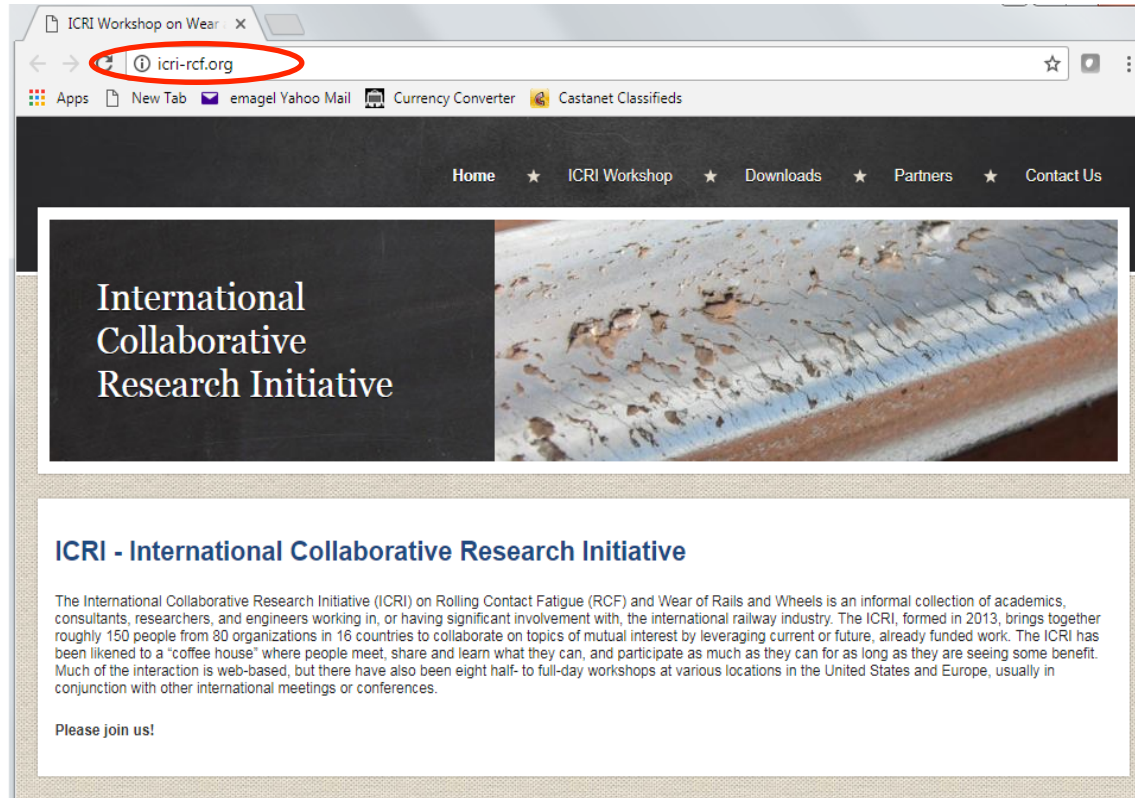

175 persons
16 countries
80 organizations

Current Projects & Leads

The screenshot shows a web browser window with the address bar containing icri-rcf.org, which is circled in red. The browser's address bar also shows a lock icon and a star icon. Below the address bar, there are several tabs: 'Apps', 'New Tab', 'emagel Yahoo Mail', 'Currency Converter', and 'Castanet Classifieds'. The website's navigation menu includes 'Home', 'ICRI Workshop', 'Downloads', 'Partners', and 'Contact Us'. The main content area features a large image of a worn metal surface with the text 'International Collaborative Research Initiative' overlaid. Below this, there is a section titled 'ICRI - International Collaborative Research Initiative' with a paragraph of text and a 'Please join us!' call to action.

International Collaborative Research Initiative

ICRI - International Collaborative Research Initiative

The International Collaborative Research Initiative (ICRI) on Rolling Contact Fatigue (RCF) and Wear of Rails and Wheels is an informal collection of academics, consultants, researchers, and engineers working in, or having significant involvement with, the international railway industry. The ICRI, formed in 2013, brings together roughly 150 people from 80 organizations in 16 countries to collaborate on topics of mutual interest by leveraging current or future, already funded work. The ICRI has been likened to a "coffee house" where people meet, share and learn what they can, and participate as much as they can for as long as they are seeing some benefit. Much of the interaction is web-based, but there have also been eight half- to full-day workshops at various locations in the United States and Europe, usually in conjunction with other international meetings or conferences.

1. Quantifying Surface Damage / Crack Modeling

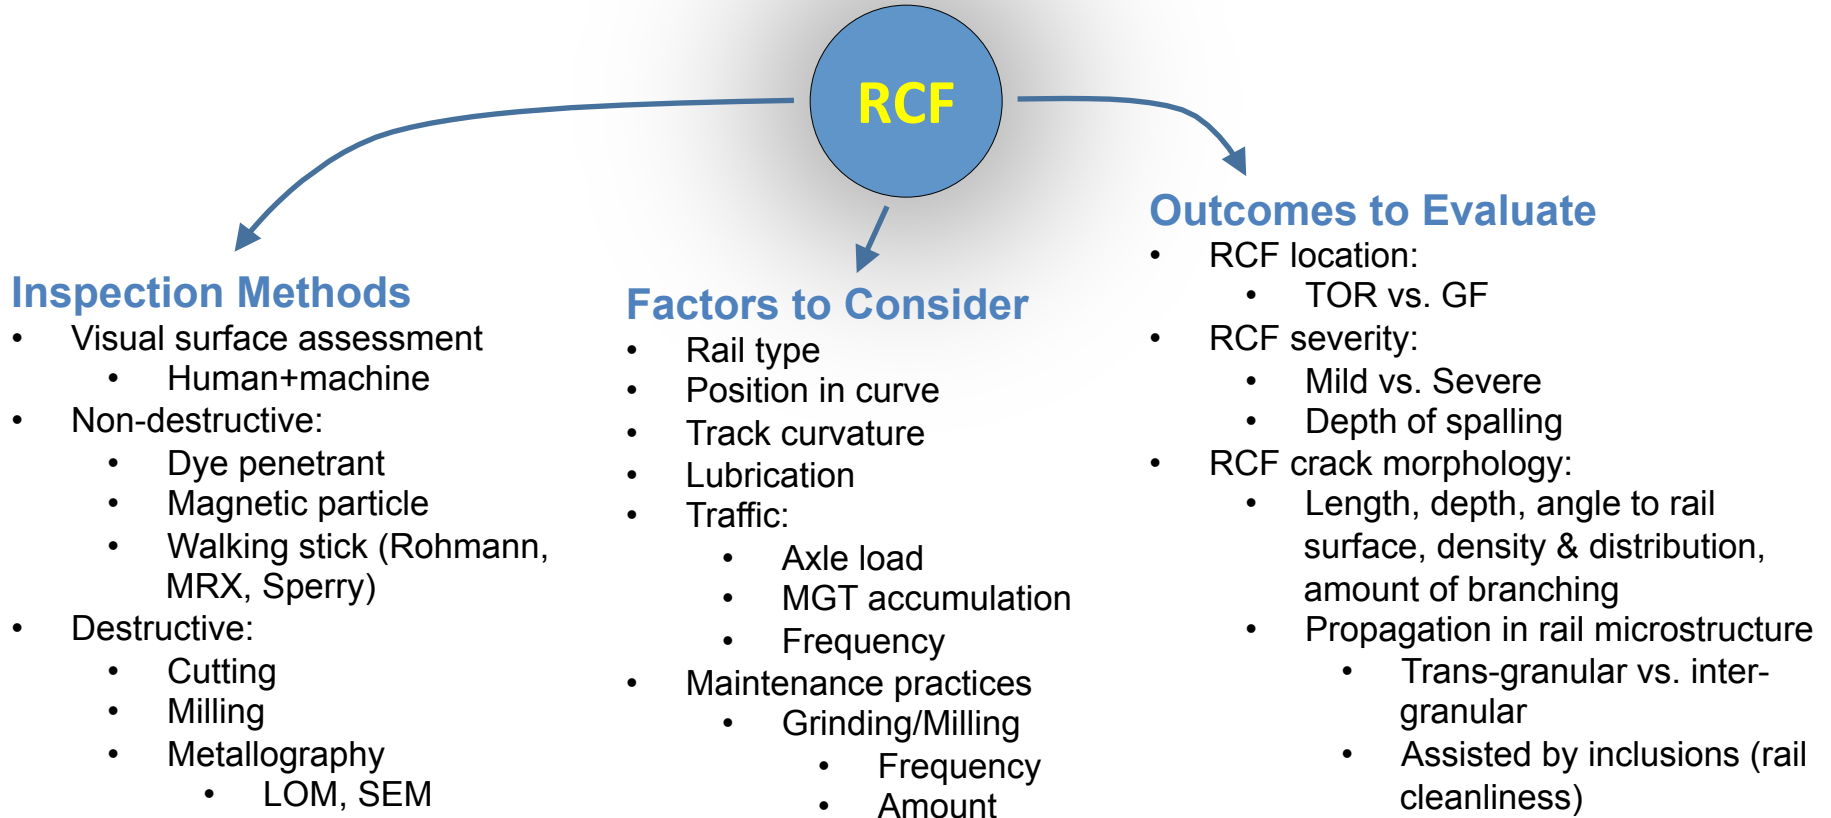

Daniel Szablewski, National Research Council, Canada

HEAVY HAUL SEMINAR • MAY 2-3, 2018

WRI 2018

Rail Performance in Service

Chemistry vs. Microstructure

Microstructure vs. Mechanical Properties

Hypoeutectoid

Eutectoid

Hypereutectoid

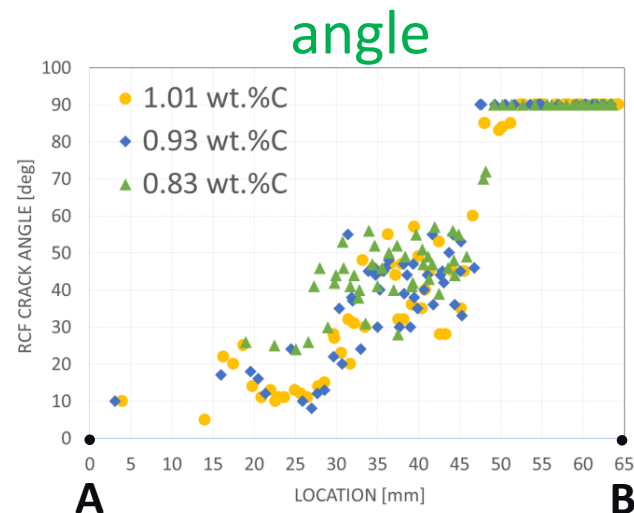

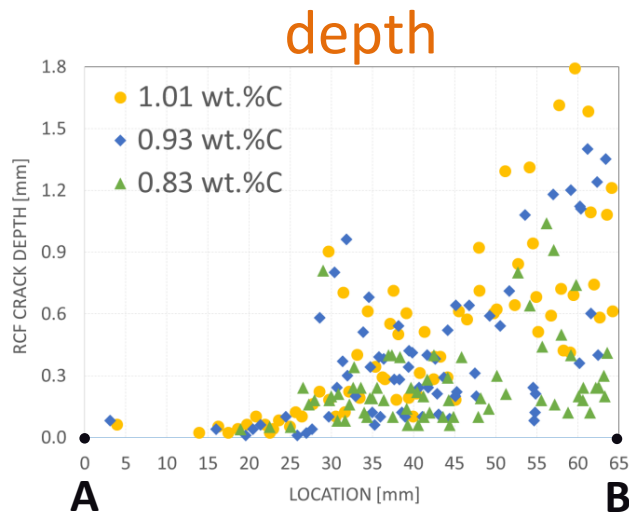

Tensile
(YS, UTS, El.)

K_{IC}

Crack Morphology

- High rail quantitative RCF assessment on a **5 degree curve**
- RCF crack **depth** & **angle** analyzed in 3 rail types with varying Carbon content

Quantifying Rail Surface Damage – RCF Matrix

Rails Analyzed to Date:

- 90 degree cut
- 45 degree cut

Layers to Consider:

- High & Low Rails
- Rail Grade (i.e. standard, intermediate, premium)
- Track Curvature (i.e. variable radius)
- Tonnage Accumulation (i.e. variable MGT in rail life-cycle)
- Running Surface Condition (i.e. dry, lubricated, TOR friction modified)
- Traffic Type (i.e. axle load, train speed)
- Maintenance Grinding (frequency and amount)

Metallography of Crack Morphology

RCF Morphology:

- Position on Rail Surface
- Length
- Maximum Depth
- Angle to Running Surface
- Amount of Branching

BNSF-7 rail:

2-Deg curve, high rail

1994 (most likely premium rail)

1-degree family of curves (preliminary results)

Assessment of RCF Length, Depth and Angle to running surface

Transverse Cut

Angle Cut Component

Note: Component calculation is for RCF Position and Length. RCF Depth and Angle are presented unchanged (as they remain the same in rail end-view).

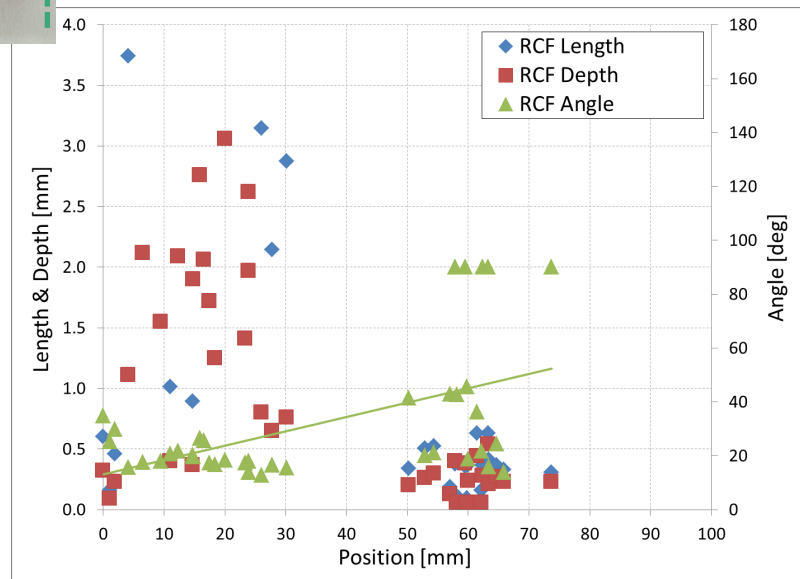

2-degree family of curves (preliminary results)

Assessment of RCF Length, Depth and Angle to running surface

Transverse Cut

Angle Cut Component

Note: Component calculation is for RCF Position and Length. RCF Depth and Angle are presented unchanged (as they remain the same in rail end-view).

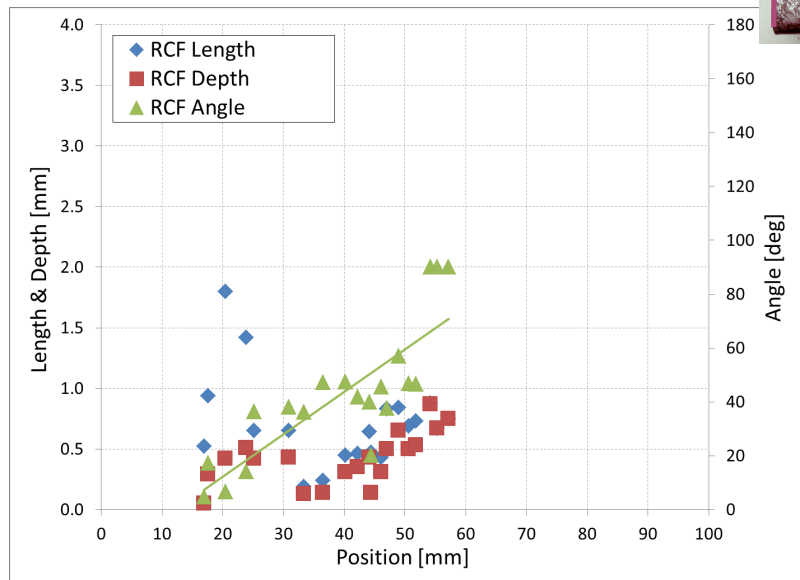

4.75-degree family of curves (preliminary results)

Assessment of RCF Length, Depth and Angle to running surface

Transverse Cut

Angle Cut Component

Note: Component calculation is for RCF Position and Length. RCF Depth and Angle are presented unchanged (as they remain the same in rail end-view).

Action Plan

- 13 rails have been analyzed to date
- Plan is to complete analysis on 25 rails by August 2018
 - => more meaningful statistical analysis of results
- Plan to include low rails in future analysis
- *Leverage RCF metallography measurements to calibrate Eddy Current probe settings (i.e. more accurate crack angle to yield more accurate results)*
- Results from RCF investigation will be presented at upcoming ICRI fall conference and 2018 Contact Mechanics conference

2. Performance of New Rail *Before First Grinding*

Bob Harris – LORAM (retired)

Dan Bjork – CN Railroad

Brad Kerchof - NS

Rail First Grind - Questions

- Is there a point where it is too late for a first grind? Does damage become irreparable at some point?
- What is the role of improper **shape** and what is the role of **mill scale** when determining the optimal first grind timeframe?
- Should new rail be rolled with a profile closer to high rail, low rail or tangent templates? If HR template is used are there adverse effects on low rails and/or tangent rails?
- What role does rail hardness play? How much of the work hardened layer is removed by grinding?
- What field tests can be conducted?

Removal of mill scale?

- Are there scientific reason for doing it?
- What would be needed for a test or evaluation
- Many transit systems require removal of mill scale prior to service
- How much material should be removed?

CN New Rail Tests

Test 1 - 4 Curves (~ 3 degree) with 3 new HR and 3 new LR

- 1 curve no grind
- 2 different grind strategies on low and high rails
- Rail was laid during fall 2016

Data includes profiles, MRX crack measurements and photographs
Measured pre-grind, post-grind & 3 months post-grind
No definitive results to date

Test 2 - High rail on a 5 degree curve with 2% grade

- Monthly traffic 3 MGT
- Ground at 18 and 21 MGT

CN New Rail Test 2

Pre-grind
15 MGT

1.9mm

Pre-grind
18 MGT

2.1mm

Post-grind
19 MGT

2.9mm

2nd Post-grind
21 MGT

3.7mm

Additional Revenue Service Tests

CSX tests

As part of a larger study on RCF growth and preventive grinding 2 low rails, 2 tangent rails and 2 high rails have been replaced and are being monitored

Ground within 6 MGT of installation

Thus far the only variables are degree of curvature

- 1 and 3 degree for the low rails
- 1 and 6.3 degree for the high rails

Wheel Rail Contact Interface (WRCI) as a method of evaluating wheel/rail contact?

WRCI is a wheel-rail contact prediction model developed by TTCI that uses:

- A population of wheel profiles that are representative of the railroad (for NS, WRCI includes 100 wheel sets with a variety of wear conditions ranging from new to 4 mm hollow-worn)
- The measured rail configurations, rail profiles, cant angles and gage
- The model results are presented as histograms showing the percentage of wheels running on each 0.05 inch of rail head width

Action Plan

- Continue with revenue service grind comparison tests on CSX and CN; determine whether a third test is needed, on NS
- Develop a rail profile based on most-desirable wheel/rail contact. Determine which template (high, low, tangent) the new rail profile should copy
- Determine work required for rail mills to change their new-rail profile
- Prepare recommendation for AREMA Committee 4

3. Optimizing the Grinding Approach

Predictive Rail Grinding

Daniel Hampton, CSX Railroad

HEAVY HAUL SEMINAR • MAY 2-3, 2018

WRI 2018

Grinding to Prevent Critical Defects

CSX – SELKIRK Subdivision

MP QG28.3 – Left Rail (H)

Track #2

Rail Service Failure – 09/17/2014

Rail Grinding – Benefits

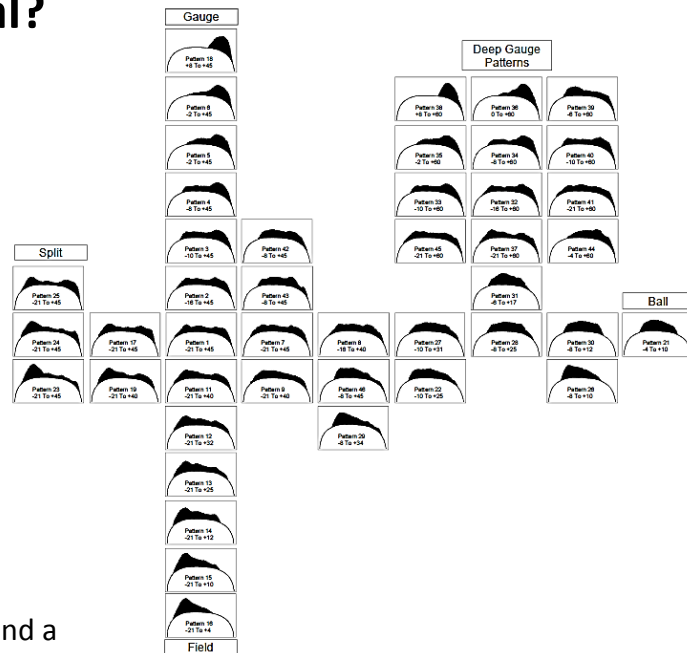

Why Grind?	Profile Correction	Surface Conditions
Benefits:	Optimize Point of Contact <ul style="list-style-type: none"> • Less rail wear • Less rail fatigue • Prolonged rail life • Less fuel consumption • Reduced vertical loads • Less vibration • Improved curving of wheel sets 	Minimize Operating Risks <ul style="list-style-type: none"> • Allows ultrasonic testing to see internal defects • Reduces vertical and lateral forces • Reduces track surfacing cycles (CAT) • Reduces rail fatigue defects (TD & SD) • Reduces rail service failures • Minimizes derailments

Rail Grinding – Current State

How to obtain the desired metal removal?

- Grind pattern selection
- Speed and downward pressure
- Number of passes*

*RIV can only call a minimum speed of 6 mph to avoid bluing the rail, and a maximum of 5 passes. Additional passes must be called by the grinding superintendent.

Rail Grinding – Insufficient RCF removal

Removal of incipient RCF cracks

- Shallow RCF is removed

- Deeper cracks remain...

Rail Grinding – New Way Forward

- **Goal: Develop condition based *Predictive Grinding* program**
 - Enables suppliers to use a standard scoring system industry wide
 - Determine how many MGT it takes to go from score to score
 - Determine when and what action is needed based on the surface condition score

SSCs have
deep cracking
in center bands

Rail Grinding - needs

0	None
1	Barely perceptible, but clearly regular pattern (preventive grinding < 0.5mm)
2	Clear, well-defined, distinct individual cracks – but no pitting > 1.5mm (maintenance, depth < 1.0 mm)
3	Clear cracking, pits up to 4 mm diameter (corrective grinding 1.5-2.5 mm deep)
4	Pitting greater than 4mm < 10 mm (preventive gradual, up to 3.5 mm deep), or “heavy” cracks with clear lifting of metal or separation of crack faces
5	Isolated pitting/shelling/spalling > 10, diameter (up to 5 mm deep)
6	Shelling/spalling: regular pitting, >10mm diameter (near impossible to catch up on)
7	Shelling/spalling: any defect > 16 mm diameter, >20mm length

Note: Machine Vision System was developed with KLD Laboratories

Rail from BNSF line

Atlas of Rail Surface Fatigue: Draft FRA report

HEAVY HAUL SEMINAR • MAY 2-3, 2018

WRI 2018

Benefits: Closer to Optimal Rail

Life

- Dynamic Track Segmentation – creates segments based on similar demand after inspection

- Complementary Grind Plans – Allow detailed work on shorter segments to meet demand variation and maximize equipment productivity

Different locations have different demands / Magic Wear Rates (optimal balance of grind without overgrinding)

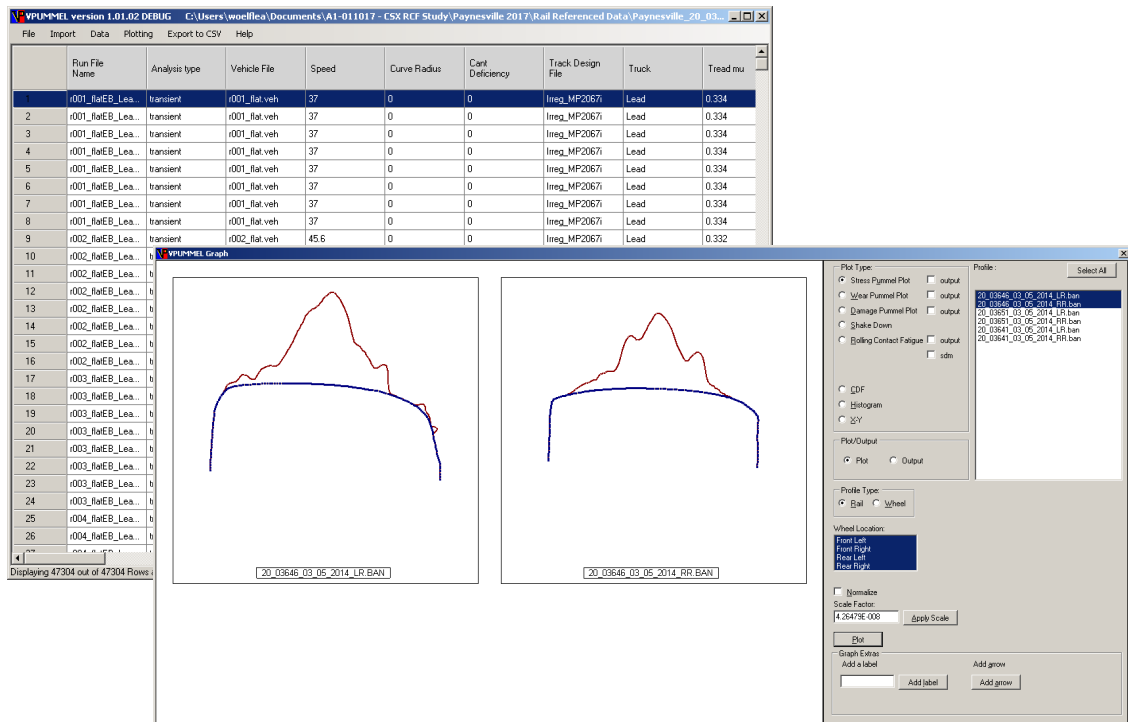

4. Damage Modeling in Rails

Alexandre Woelfle and Wei Huang – National Research Council, Canada
Klaus Six – Virtual Vehicle (Austria)

Damage Modeling - Pummeling

Damage Modeling – Plotting RCF

"Wedge" model: Surface deformation pattern, Pos 20_4116

high rail

Conclusions

- ICRI is working in several areas to improve understanding and maintenance of RCF
- More support is needed
 - Rail samples
 - Metallurgical sectioning
 - Leadership

Next ICRI Workshop

- Delft, Holland
- September 23, 2018
- Adjacent to CM2018 conference
 - www.cm2018.org

Thank You
